SLB Specifications

Specifications (MIL-PRF-39012 as applicable)

Materials:

Body components, male contacts: Brass per ASTM-B-16, alloy 360, 1/2 hard.

Female contacts: Beryllium copper per ASTM-B-196, Condition HT.

Insulators: Teflon TFE per ASTM-D-1710.

Finish:

Center contacts: Gold plated per current revision of MIL-PRF-39012*

Other metal parts: Gold or nickel plated to meet current MIL-PRF-39012 corrosion requirements.*

Electrical:

Impedance: 50Ω. **Frequency range:** DC–4 GHz. **Insulation Resistance:** 1,000 megohms minimum.

Voltage Rating: 250VRMS @ sea level (RG-178 cable); 335VRMS @ sea level (RG-316 cable).

Dielectric Withstanding Voltage: 750VRMS @ sea level (RG-178 cable); 1000VRMS @ sea level (RG-316 cable).

Contact Resistance:

Straight connectors: Initial: 6 milliohms maximum; after environmental test conditions: 8 milliohms maximum.

Right angle connectors: Initial: 12 milliohms maximum; after environmental test conditions: 16 milliohms maximum.

Corona level: 125V @70,000 ft. **RF highpot:** 400 VRMS @ 5 MHz.

RF leakage: -55 dB min @ 2–3 GHz. **Insertion loss:** .30 dB max (straight connectors), .60 dB max (right angle connectors) @ 1.5 GHz.

VSWR:	Cable	Straight connector	Right angle connector
	RG-178	$1.30 + (.04 \times F[\text{GHz}])$	$1.45 + (.06 \times F[\text{GHz}])$
	RG-316	$1.25 + (.04 \times F[\text{GHz}])$	$1.35 + (.04 \times F[\text{GHz}])$

Mechanical:

Force to engage: 6 pounds max.

Contact retention: 2 pounds min axial force. **Durability:** 500 mating cycles.

Environmental (MIL-STD-202):

Temperature range: -65° C to +165° C. **Corrosion:** Method 101, condition B, 5% salt solution.

Vibration (Method 204): N/A.

Mechanical shock (Method 213): N/A. **Thermal shock (Method 107):** Condition B.

*These specifications change periodically with updates to MIL-PRF-39012 requirements. Contact factory for latest specifications.

Interface Dimensions

SLB Cable Attachment Methods

All SLB cable connectors in this catalog have captivated contacts which are soldered to the cable center conductor.

Both crimp and clamp types for flexible cable grip the cable braid with a force greater than the breaking strength of the braid.

Clamp Type For Flexible Cable

These connectors can be assembled without special tooling, and are field replaceable. They provide metal-to-metal clamping of the cable braid.

Crimp Type For Flexible Cable

Crimping the cable braid is the most reliable and repeatable method of cable assembly, and provides support for the cable during flexure. AEP crimp type connectors are assembled quickly and easily using readily-available commercial or MIL crimp tools.

Solder-Clamp For Semi-Rigid Cable

This method allows retrimming of the cable dielectric, if necessary, during assembly. Connectors can be repositioned relative to the cable after assembly by loosening the clamp nut. Solder-clamp connectors are field replaceable without special tools.

SLB Float Mount / Blind Mate

Introduction

This series of SLB connectors with float mount hardware can provide a low-cost alternative to other blind-mate connector systems in applications below 4 GHz.

The radial float of the panel mounted connectors, combined with the closed-entry mating end hood of the plugs, allows the mating pairs to be misaligned up to .025" without damage occurring during mating. Since the axial float is not spring-loaded, panel-to-panel separation should be maintained within $\pm .010$ " of the recommended dimension when mated.

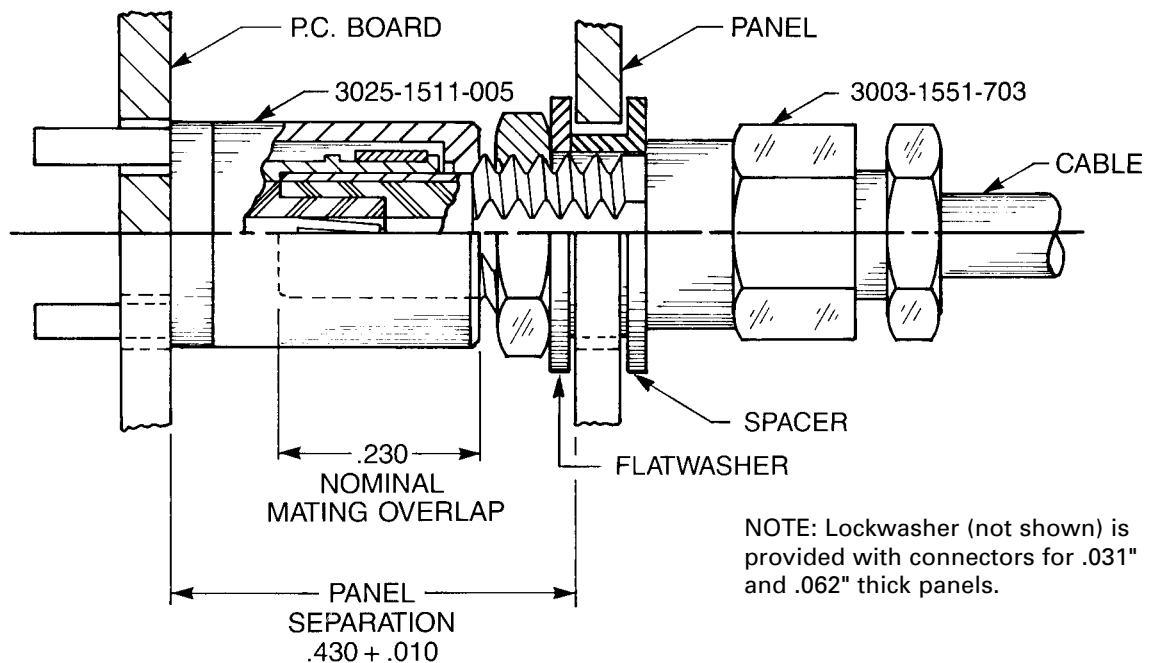

Mating force per connector pair is 3 pounds maximum, and unmating force is 8 ounces minimum per pair. External actuators, such as levers, guide rails, or jackscrews, should be incorporated in applications requiring simultaneous mating of multiple connector pairs. This is particularly important when one side is mounted to a P.C. board.

Only one side of the mating [pair should be float mounted; float mounting both connectors in a mating pair will allow a radial float that exceeds the plug mating end hood's ability to guide the jack into proper orientation.

This style of float mounting is not recommended for applications which undergo vibration while powered. Vibration of this style of float mounting can cause intermittent ground interrupts. For SLB connectors with vibration-proof float mounts, see page 20.

Mating Detail

MATING DETAIL, 3025-1511-005 AND 3003-1551-703

To determine panel separation: Add projection from panel or P.C. board for each connector in the mating pair and subtract the nominal mating overlap (.230"). the projection for each connector is shown on the product pages, and is measured with all axial float loaded toward the panel. Axial float is .008" for all connectors.

Radial float: Because these connectors provide a maximum .025" radial float, panels can be drilled up to .255" mounting hole diameter. Center-to-center tolerances of drilled panel holes should be subtracted from this diameter to keep within maximum float tolerances.

SLB Vibration-Proof Float Mounts

Introduction

AEP's vibration-proof float mounted connectors use a tempered spring washer within the mounting system for reliable grounding between the connector and the panel under vibration. This system, combined with closed-end mating hoods and contacts, allows the connectors a wide range of float while mating without damage to the connectors.

AEP vibration-proof float mount connectors meet appropriate performance requirements of MIL-PRF-39012. The items on the next page are only the most commonly-used configurations; vibration-proof mounting hardware can be provided with any bulkhead-mounted SLB plug or jack in this catalog. All connectors shown have gold-plated, captive contacts and gold-plated bodies.

How They Work

Standard Float Mounts

Connectors that use shoulder washers as a float mount can, under vibration, intermittently become "suspended" in their mounting holes—resulting in loss of electrical contact between body and panel.
(Proportions exaggerated to illustrate detail.)

AEP Vibration-Proof Float Mounts

The Truarc retaining provides almost 360° of contact with its retaining groove, rather than the 10–20° of contact of C-rings or E-rings.

AEP's closed-entry mating end hood and center contact resist damage from misaligned mating connectors.

The spring washer ensures consistent grounding under vibration.

Misaligned connectors press against the tapered hood during mating...

...and the hood guides the float-mounted connector into alignment for proper mating, while the spring washer deflects to accommodate the angular and radial movement with no loss of grounding.

Cable Assembly Instructions

Clamp type connectors for flexible cable

Straight Connectors—Flexible Cable

Parts list

1

- Trim cable per trim code below; tin end of center conductor.
- Slide backnut onto cable. Slide compression washer onto cable in the orientation shown until it stops against cable jacket.
- Flare cable braid by rotating dielectric and slide ferrule under braid.

2

- Press ferrule against compression washer.
- Trim excess braid flush with outer diameter of compression washer and ferrule.
- Assemble insulator over cable center conductor and dielectric.

3

- Assemble contact onto cable center conductor.
- Solder contact to center conductor by heating rear of contact (do not feed additional solder through inspection hole in contact).

4

- Insert cable assembly into body assembly. Tighten to 90–100 inch-ounces torque. (Hold cable/hardware assembly stationary and rotate body when tightening.)

Cable Trim Dimensions

CONNECTOR TYPE	A	B	C
STRAIGHT CONNECTORS	.080	.120	.240
RIGHT ANGLE CONNECTORS	.080	.180	.300

Right Angle Connectors—Flexible Cable

1

- Trim cable per trim code below; tin end of center conductor.
- Slide backnut onto cable. Slide compression washer onto cable in the orientation shown until it stops against cable jacket.
- Flare cable braid by rotating dielectric and slide ferrule under braid.

2

- Press ferrule against compression washer.
- Trim excess braid flush with outer diameter of compression washer and ferrule.
- Assemble insulator over cable center conductor and dielectric.

3

- Insert cable assembly into body assembly. Tighten to 90–100 inch-ounces torque. (Hold cable/hardware assembly stationary and rotate body when tightening.)
- Solder center conductor into notch in rear of contact with .025–.032" diameter chisel-tip soldering iron.
- Solder should cover center conductor, but not extend over top of notch in contact, or exceed contact diameter.

4

- Place insulator in body cavity, and press cap into place. Properly assembled cap will be slightly below end of body assembly.

Cable Assembly Instructions

Crimp type connectors for flexible cable

Straight Connectors—Flexible Cable

Parts list

1

- Trim cable per trim code below; tin end of center conductor.
- Slide heat-shrink tubing and crimp sleeve over cable.
- Flare cable braid by rotating dielectric and slide cable into crimp tail.

2

- Position cable so braid touches rear of back nut.
- Slide crimp sleeve forward to touch rear of back nut.
- Crimp braid with appropriate die size from chart below.

3

- Assemble insulator and contact onto cable dielectric and center conductor.
- Solder contact to center conductor by heating rear of contact (do not feed additional solder through inspection hole in contact).

4

- Insert cable assembly into body assembly. Tighten to 90–100 inch-ounces torque. (Hold cable/hardware assembly stationary and rotate body when tightening.)
- Slide shrink tubing over crimp sleeve and shrink to fit.

Cable Trim Dimensions

CONNECTOR TYPE	A	B	C
STRAIGHT CONNECTORS	.100	.430	.700
RIGHT ANGLE CONNECTORS	.070	.200	.450

Right Angle Connectors—Flexible Cable

1

- Trim cable per trim code below; tin end of center conductor.
- Slide heat-shrink tubing and crimp sleeve over cable.
- Flare cable braid by rotating dielectric and slide cable into crimp tail.

2

- Position cable so braid touches rear of body assembly.
- Slide crimp sleeve forward to touch rear of body assembly.
- Crimp braid with appropriate die size from chart below.

3

- Solder center conductor into notch in rear of contact with .025–.032" diameter chisel-tip soldering iron.
- Solder should cover center conductor, but not extend over top of notch in contact, or exceed contact diameter.

4

- Place insulator in body cavity, and press cap into place. Properly assembled cap will be slightly below end of body assembly.
- Slide shrink tubing over crimp sleeve and shrink to fit.

03	.128
05	.128
19	.128

Cable Assembly Instructions

Solder-clamp connectors for semi-rigid cable

Straight Connectors—Semi-Rigid Cable

Parts list

1

- Trim cable per trim code below; tin end of center conductor.
- Slide backnut over cable. Slide solder ferrule over cable until it stops against cable jacket.
- Solder cable jacket to ferrule.

2

- Assemble insulator and contact onto cable dielectric and center conductor. If insulator is not flush against solder ferrule due to dielectric extrusion, retrim dielectric.
- Solder contact to center conductor by heating rear of contact (do not feed additional solder through inspection hole in contact).

3

- Insert cable assembly into body assembly. Tighten to 90–100 inch-ounces torque. (Hold cable/hardware assembly stationary and rotate body when tightening.)

Right Angle Connectors—Semi-Rigid Cable

Parts list

1

- Trim cable per trim code below; tin end of center conductor.
- Slide backnut over cable. Slide solder ferrule over cable until it stops against cable jacket.
- Solder cable jacket to ferrule.

2

- Insert cable assembly into body assembly. Tighten to 90–100 inch-ounces torque. (Hold cable/hardware assembly stationary and rotate body when tightening.)
- Solder center conductor into notch in rear of contact with .025–.032" diameter chisel-tip soldering iron.
- Solder should cover center conductor, but not extend over top of notch in contact, or exceed contact diameter.

3

- Place insulator in body cavity, and press cap into place. Properly assembled cap will be slightly below end of body assembly.

Cable Trim Dimensions

CONNECTOR TYPE	A	B

About Applied Engineering Products

Since our foundation in 1973, we have always believed that having our customers take a look "inside AEP" is important in fostering strong vendor/customer relationships. We are proud of our physical plant and equipment, but even more so of our dedicated staff. When customers see first-hand how AEP's people keep a constant focus on maintaining and improving

customer service and satisfaction, the reason for our consistently strong on-time delivery and quality records becomes clear.

We invite you to see for yourself. Call us to arrange a plant tour—or, if you can't make a visit, ask for your copy of *INSIDE AEP*, our facilities and capabilities brochure.

The SLB connectors in this brochure are only part of our complete line of subminiature coaxial connectors and cable assemblies, including:

- SMA
- SMB
- SMC
- SSMB
- SSMC
- SLB (Slide-on version of SMB)
- SSLB (Slide-on version of SSMB)
- 75Ω Snap-on mating
- 75Ω Screw-on mating
- Adapters within and between series
- Flexible cable assemblies
- Semi-rigid cable assemblies
- And over 100 styles of MIL-PRF-39012 QPL connectors in series SMA, SMB, and SMC

Call for your copy of our 184-page full catalog to see them all.
